# Definition of Sample Mean and Sample Variance

Def.

Let  $X_1, X_2, \dots, X_n$  be independent identically distributed (iid) random variables. Then we define:

- *sample mean* as

$$\bar{X} = \frac{1}{n} \sum_{k=1}^n X_k$$

- *sample variance* as

$$S^2 = \frac{1}{n-1} \sum_{k=1}^n (X_k - \bar{X})^2$$

# Independence of Sample Mean and Sample Variance

Thm.

If  $X_1, X_2, \dots, X_n \stackrel{\text{iid}}{\sim} \text{Normal}(\mu, \sigma^2)$  then

$\bar{X}$  and  $(X_1 - \bar{X}, X_2 - \bar{X}, \dots, X_n - \bar{X})$  are independent.

# Independence of Sample Mean and Sample Variance

## Thm.

If  $X_1, X_2, \dots, X_n \stackrel{\text{iid}}{\sim} \text{Normal}(\mu, \sigma^2)$  then

$\bar{X}$  and  $(X_1 - \bar{X}, X_2 - \bar{X}, \dots, X_n - \bar{X})$  are independent.

## Corollary

If  $X_1, X_2, \dots, X_n \stackrel{\text{iid}}{\sim} \text{Normal}(\mu, \sigma^2)$  then

$\bar{X}$  and  $S^2$  are independent.

# Population Parameters: Mean and Variance

Def.

Let population of size  $N$  consist of  $x_1, x_2, \dots, x_N$  values. Then we define:

- *population mean* as

$$\mu = \frac{1}{N} \sum_{i=1}^N x_i$$

- *population variance* as

$$\sigma^2 = \frac{1}{N} \sum_{i=1}^N (x_i - \mu)^2$$

# Population Parameters: Mean and Variance

## Claim

$$\begin{aligned}\sigma^2 &= \frac{1}{N} \sum_{i=1}^N (x_i - \mu)^2 \\ &= \frac{1}{N} \sum_{i=1}^N x_i^2 - \mu\end{aligned}$$

  - Expectation of  $s_{\bar{X}}^2$

# Definition of SRS, $X_1, X_2, \dots, X_n$

Def.

Sampling from a population of size  $N$  in way that each of the  $\binom{N}{n}$  possible samples of size  $n$  taken without replacement has the same probability of occurrence, is called *simple random sampling*.

We denote observed sampling values by

$$X_1, X_2, \dots, X_n.$$

Remark

- ① Note that for each  $i \in \{1, 2, \dots, n\}$ ,
  - ▶  $X_i$  is not same as  $x_i$ , the  $i$ -th population value
  - ▶  $X_i$  is a random variable (r.v.)
  - ▶  $X_i$  is not independent of  $X_j$ ,  $j \in \{1, 2, \dots\}$

# Probability Distributions of Sampling Values, $P(X_i = x)$

## Lemma

Denote the distinct values assumed by the population members by  $\xi_1, \xi_2, \dots, \xi_m$ , and denote the number of population members that have the value  $\xi_k$  by  $n_k$ , where  $k \in \{1, 2, \dots, m\}$ .

Then, given  $i \in \{1, 2, \dots, n\}$ ,  $X_i$  is a discrete random variable with the following probability mass function:

$$P(X_i = \xi_k) = \frac{n_k}{N} \quad \text{for } k \in \{1, 2, \dots, m\}.$$

Also, for each  $i \in \{1, 2, \dots, n\}$ ,

$$\begin{aligned} E[X_i] &= \mu \\ \text{Var}(X_i) &= \sigma^2 \end{aligned}$$

# Definition of Sample Mean of SRS, $\bar{X}$

Def.

Let  $X_1, X_2, \dots, X_n$  denote the sample values. We define the *sample mean* as

$$\bar{X} = \frac{1}{n} \sum_{i=1}^n X_i.$$

Remark

- ① Note that for each  $i \in \{1, 2, \dots, n\}$ ,
  - ▶  $X_i$  is not same as  $x_i$ , the  $i$ -th population value
  - ▶  $X_i$  is a random variable (r.v.)
  - ▶  $X_i$  is not independent of  $X_j$ ,  $j \in \{1, 2, \dots\}$
- ② Note that
  - ▶  $\bar{X}$  is a random variable (r.v.); distribution of  $\bar{X}$  will be referred to as *sampling distribution* of  $\bar{X}$
  - ▶ the sampling distribution of  $\bar{X}$  determines how accurately  $\bar{X}$  estimates the population mean,  $\mu$

# Expected Value of Sample Mean, $E[\bar{X}]$

Thm.

Assuming simple random sampling from a population with the population mean  $\mu$ ,

$$E[\bar{X}] = \mu.$$

# Covariance between Two Sampling Values, $\text{Cov}(X_i, X_j)$

## Lemma

For simple random sampling (i.e. without replacement),

$$P(X_i = \xi_l | X_j = \xi_k) = \begin{cases} \frac{n_l}{N-1}, & \text{if } k \neq l, \\ \frac{n_l-1}{N-1}, & \text{if } k = l, \end{cases}$$

and

$$\text{Cov}(X_i, X_j) = -\frac{\sigma^2}{N-1} \quad \text{if } i \neq j.$$

# Variance of Sample Mean, $\text{Var}(\bar{X})$

Thm.

Assuming simple random sampling from a population with the population variance  $\sigma^2$ ,

$$\begin{aligned}\text{Var}(\bar{X}) &= \frac{\sigma^2}{n} \left( \frac{N - n}{N - 1} \right) \\ &= \frac{\sigma^2}{n} \underbrace{\left( 1 - \frac{n - 1}{N - 1} \right)}_{\text{finite population correction}}\end{aligned}$$

  - Expectation of  $\hat{\sigma}^2$
  - Expectation of  $s_{\bar{X}}^2$

## Expectation of $\hat{\sigma}^2$

Thm.

Assuming simple random sampling from a population with the population variance  $\sigma^2$ ,

$$E[\hat{\sigma}^2] = \sigma^2 \left( \frac{n-1}{n} \right) \frac{N}{N-1},$$

where

$$\hat{\sigma}^2 = \frac{1}{n} \sum_{i=1}^n (X_i - \bar{X})^2.$$

Remark

If

$$E[\hat{\sigma}^2] \neq \sigma^2,$$

we will say that  $\hat{\sigma}^2$  is *biased* estimator of  $\sigma^2$ .

# Expectation of $s_{\bar{X}}^2$

## Corollary

Assuming simple random sampling from a population with the population variance  $\sigma^2$ ,

$$s_{\bar{X}}^2 = \frac{\hat{\sigma}^2}{n} \left( \frac{n}{n-1} \right) \left( \frac{N-1}{N} \right) \left( \frac{N-n}{N-1} \right)$$

is an unbiased estimate of  $\text{Var}(\bar{X})$ , that is,

$$\mathbb{E}[s_{\bar{X}}^2] = \text{Var}(\bar{X}).$$

## Remark

Note that

$$s_{\bar{X}}^2 = \frac{S^2}{n} \left( 1 - \underbrace{\frac{n}{N}}_{\text{sampling fraction}} \right), \quad \text{where} \quad S^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2.$$
